Preface	xii
Acknowledgements	xiv
Part I Basic Concepts of Mathematical Epidemiology	
1 Introduction: A Prelude to Mathematical Epidemiology	3
1.1 Introduction	3
1.2 Some History	4
1.2.1 The Beginnings of Compartmental Models	5
1.2.2 Stochastic Models	7
1.2.3 Developments in Compartmental Models	9
1.2.4 Endemic disease models	11
1.2.5 Diseases transmitted by vectors	12
1.2.6 Heterogeneity of mixing	14
1.3 Strategic Models and this Volume	15
References	16
2 Simple Compartmental Models for Disease Transmission	21
2.1 Introduction to Compartmental Models	22
2.2 The <i>SIS</i> Model	26
2.3 The <i>SIR</i> Model with Births and Deaths	30
2.4 The Simple Kermack-McKendrick Epidemic Model	34
2.5 Epidemic Models with Deaths due to Disease	42
2.6 *Project: Discrete Epidemic Models	44
2.7 *Project: Pulse Vaccination	46
2.8 *Project: A Model with Competing Disease Strains	48
2.9 Project: An Epidemic Model in Two Patches	51
2.10 Project: Fitting Data for an Influenza Model	51
2.11 Project: Social Interactions	52
2.12 Exercises	53

References	58
3 Endemic Disease Models	61
3.1 More Complicated Endemic Disease Models	62
3.1.1 Exposed periods	62
3.1.2 A treatment model	63
3.1.3 Vertical transmission	65
3.2 Some Applications of the <i>SIR</i> Model	66
3.2.1 Herd immunity	66
3.2.2 Age at infection	67
3.2.3 The inter-epidemic period	69
3.2.4 “Epidemic” approach to endemic equilibrium	70
3.3 Temporary Immunity	71
3.3.1 *Delay in an <i>SIRS</i> model	72
3.4 A Simple Model with Multiple Endemic Equilibria	75
3.5 A Vaccination Model: Backward Bifurcations	77
3.5.1 The bifurcation curve	83
3.6 *An <i>SEIR</i> Model with General Disease Stage Distributions	85
3.6.1 *Incorporation of quarantine and isolation	89
3.6.2 *The reduced model of (3.42) under GDA	91
3.6.3 *Comparison of EDM and GDM	93
3.7 Diseases in Exponentially Growing Populations	96
3.8 Project: Population Growth and Epidemics	98
3.9 *Project: An Environmentally Driven Infectious Disease	103
3.10 *Project: A Two-Strain Model with Cross Immunity	107
3.11 Exercises	109
References	111
4 Epidemic Models	115
4.1 A Branching Process Disease Outbreak Model	116
4.1.1 Transmissibility	121
4.2 Network and Compartmental Epidemic Models	123
4.3 More Complicated Epidemic Models	126
4.3.1 Exposed periods	126
4.3.2 A treatment model	128
4.3.3 An influenza model	130
4.3.4 A quarantine-isolation model	131
4.4 An <i>SIR</i> model with a General Infectious Period Distribution	134
4.5 The Age of Infection Epidemic Model	136
4.5.1 A general <i>SEIR</i> model	138
4.5.2 A general treatment model	140
4.5.3 A general quarantine/isolation epidemic model	141
4.6 The Gamma Distribution	144
4.7 Interpretation of Data and Parametrization	146
4.7.1 Models of <i>SIR</i> Type	147

4.7.2	Models of <i>SEIR</i> Type	148
4.7.3	Mean Generation Time	151
4.8	*Effect of Timing of Control Programs on Epidemic Final Size	153
4.9	Directions for Generalization	155
4.10	Some Warnings	156
4.11	*Project: A Discrete Model with Quarantine and Isolation	156
4.12	Project: Epidemic Models with Direct and Indirect Transmission	162
4.13	Exercises	165
	References	170
5	Models with Heterogeneous Mixing	173
5.1	A Vaccination Model	173
5.2	The Next Generation Matrix and the Basic Reproduction Number	175
5.2.1	Some More Complicated Examples	181
5.3	Heterogeneous Mixing	181
5.3.1	*Optimal vaccine allocation in heterogeneous populations	195
5.4	A Heterogeneous Mixing Age of Infection Model	201
5.4.1	The final size of a heterogeneous mixing epidemic	203
5.5	Some Warnings	207
5.6	*Projects: Reproduction Numbers for Discrete Models	208
5.7	*Project: Modeling the Synergy between HIV and HSV-2	211
5.8	Project: Effect of Heterogeneities on Reproduction Numbers	214
	References	215
6	Models for Diseases Transmitted by Vectors	219
6.1	Introduction	219
6.2	A Basic Vector Transmission Models	220
6.2.1	The basic reproduction number	222
6.2.2	The initial exponential growth rate	223
6.3	Fast and Slow Dynamics	224
6.3.1	Singular perturbations	226
6.4	A Vector-borne Epidemic model	228
6.4.1	A final size relation	229
6.5	*Project: An <i>SEIR/SEI</i> Model	230
6.6	*Project: Models for Onchocerciasis	231
6.7	Exercises	233
	References	234
Part II Models for Specific Diseases		
7	Models for Tuberculosis	239
7.1	A One-strain Model with Treatment	241
7.2	A Two-strain TB Model	242
7.3	Optimal Treatment Strategies	246
7.4	Modeling of the Long and Variable Latency of TB	251
7.5	Backward Bifurcation in a TB Model with Reinfection	253

7.6	Other TB Models with More Complexities	255
7.7	Project: Some calculations for the Two Strain Model	257
7.8	Project: Refinements of the One-Strain Model	258
7.9	Project: Refinements of the Two-strain Model	260
	References	262
8	Models for HIV/AIDS	265
8.1	Introduction	265
8.2	A Model with Exponential Waiting Times	267
8.3	An HIV Model with Arbitrary Incubation Period Distributions	270
8.4	An Age of Infection Model	273
8.5	*HIV and Tuberculosis: Dynamics of Co-infections	275
8.6	*Modeling the Synergy between HIV and HSV-2	283
8.6.1	Reproduction numbers for individual diseases	286
8.6.2	Invasion reproduction numbers	288
8.6.3	Influence of HSV-2 on the dynamics of HIV	289
8.7	An HIV Model with Vaccination	290
8.8	A Model with Antiretroviral Therapy (ART)	291
8.9	Project: What If Not All Infectives Progress to AIDS?	293
	References	295
9	Models for Influenza	303
9.1	Introduction to Influenza Models	303
9.2	A Basic Influenza Model	304
9.2.1	Vaccination	307
9.3	Antiviral Treatment	310
9.4	Seasonal Influenza Epidemics	315
9.4.1	Season to Season Transition	317
9.5	Pandemic Influenza	318
9.5.1	A pandemic outbreak	318
9.5.2	Seasonal outbreaks following a pandemic	319
9.6	The Influenza Pandemic of 2009	321
9.6.1	A tactical influenza model	322
9.6.2	Multiple epidemic waves	323
9.6.3	Parameter estimation and forecast of the fall wave	325
9.7	*An SIQR model with Multiple Strains with Cross Immunity	328
9.7.1	*An SIQR Model with a Single Infectious Class	330
9.7.2	*The case of two strains with cross Immunity	334
9.8	Exercises	338
	References	339
10	Models for Ebola	343
10.1	Estimation of initial growth and reproduction numbers	343
10.1.1	Early detection	349
10.2	Evaluations of control measures	352

10.3	The Legrand model and underlying assumptions	353
10.3.1	The Legrand model	354
10.3.2	A simpler system equivalent to the Legrand model	355
10.4	*Models with various assumptions on stage transition times	356
10.5	Slower than Exponential Growth	372
10.5.1	The generalized Richards model	373
10.5.2	The generalized growth model	373
10.5.3	The IDEA model	374
10.5.4	Models with decreasing contact rates	375
10.6	Project: Slower than Exponential Growth	375
10.7	Project: Movement Restrictions as a Control Strategy	376
10.8	Project: Effect of Early Detection	377
	References	378
11	Models for Malaria	381
11.1	A Malaria Model	381
11.2	Some Model Refinements	385
11.2.1	Mosquito incubation periods	385
11.2.2	Boosting of immunity	386
11.2.3	Alternative forms for the force of infection	387
11.3	*Coupling Malaria Epidemiology and Sickle Cell Genetics	387
	References	396
12	Dengue Fever and the Zika Virus	399
12.1	Dengue Fever	399
12.1.1	Calculation of the basic reproduction number	401
12.2	A Model with Asymptomatic Infectives	402
12.2.1	Calculation of the basic reproduction number	402
12.3	The Zika Virus	403
12.4	A Model with Vector and Direct Transmission	404
12.4.1	The initial exponential growth rate	407
12.5	A Second Zika Virus Model	409
12.6	Project: A Dengue Model with Two Patches	410
	References	412
Part III More Advanced Concepts		
13	Disease Transmission Models with Age Structure	419
13.1	Introduction	419
13.2	Linear Age Structured Models	420
13.3	The Method of Characteristics	422
13.4	Equivalent Formulation as an Integral Equation Model	422
13.5	Equilibria and the characteristic equation	424
13.6	The Demographic Model with Discrete Age Groups	425
13.7	Nonlinear Age Structured Models	426
13.8	Age Structured Epidemic Models	428

13.8.1	*Age-dependent Vaccination in Epidemic Models	429
13.8.2	Pair-Formation in Age-Structured Epidemic Models	434
13.9	A Multi-Age-Group Malaria Model	435
13.10*	Project: Another Malaria Model	437
13.11	Project: A Model without Vaccination	439
13.12	Project: An <i>SIS</i> Model with Age of Infection Structure	440
13.13	Exercises	441
	References	441
14	Spatial Structure in Disease Transmission Models	445
14.1	Spatial Structure I: Patch Models	445
14.1.1	Spatial heterogeneity	445
14.1.2	Patch models with travel	447
14.1.3	Patch models with residence times	449
14.2	Spatial Structure II: Continuously Distributed Models	452
14.2.1	The diffusion equation	452
14.2.2	Nonlinear reaction-diffusion equations	454
14.2.3	Disease spread models with diffusion	456
14.3	Project: A Model with Three Patches	459
14.4	Project: A Patch Model with Residence Time	461
	References	462
15	Epidemiological Models Incorporating Mobility, Behavior and Time Scales.	465
15.1	Introduction	465
15.2	General Lagrangian Epidemic Model in an <i>SIS</i> Setting	467
15.3	Assessing the Efficiency of Cordon Sanitaire as a Control Strategy of Ebola	469
15.3.1	Formulation of the model	469
15.3.2	Simulations	470
15.4	*Mobility and Health Disparities on the Transmission Dynamics of Tuberculosis	473
15.4.1	*A two-patches TB model with heterogeneity in population through residence times in the patches	474
15.4.2	*Results: The role of risk and mobility on TB prevalence.	474
15.5	*ZIKA	478
15.5.1	*Single patch model	479
15.5.2	*Residence times and two-patch models	480
15.5.3	What did we learn from these single outbreak simulations?	487
	References	489

Part IV The Future

16 Challenges, Opportunities and Theoretical Epidemiology	495
16.1 Disease and the Global Commons	496
16.1.1 Contagion and tipping points	496
16.1.2 Geographic and spatial disease spread	497
16.2 Heterogeneity of Mixing, Cross Immunity, and Co-infection	498
16.3 Antibiotic Resistance	498
16.4 Mobility	500
16.4.1 A Lagrangian approach to modeling mobility and infectious disease dynamics	501
16.5 Behavior, Economic Epidemiology and Mobility	508
16.5.1 Economic epidemiology	509
16.5.2 Lagrangian and economic epidemiology models	511
References	512
Epilogue	521
References	525
Part V Appendix	
Appendix	529
Vectors and Matrices	531
A.1 Introduction	531
A.2 Vectors and Matrices	531
A.3 Systems of Linear Equations	535
A.4 The Inverse Matrix	536
A.5 Determinants	537
A.6 Eigenvalues and Eigenvectors	540
First Order Equations	545
B.1 Exponential Growth and Decay	545
B.2 Radioactive decay	547
B.3 Solutions and Direction Fields	549
B.4 Equations with Variables Separable	555
B.5 Qualitative Properties	560
Systems of Differential Equations	569
C.1 The Phase Plane	569
C.2 Linearization at an Equilibrium	571
C.3 Linear Systems with Constant Coefficients	574
C.4 Stability of Equilibria	582
C.5 Qualitative Behavior of Solutions of Linear Systems	586
