

① Prove that the product of a positive number with a negative number is negative; and the product of two negative numbers is positive.

Once you solve and turn in your solution to ①, you will be allowed to use the standard rules to manipulate inequalities, without giving detailed justification. (But make sure you use the correct rules!)

- ② Is the function  $f: \mathbb{R} \rightarrow \mathbb{R}$  given by  $f(x) = \frac{2x}{x^2+1}$  injective?  
 (If answer is yes, prove it. If answer is no, prove it.)
- ③ Is the set  $S = \{x \in \mathbb{R}: 2x+5 > 0\}$  bounded above?  
 bounded below?
