

- Know: 1)  $\mathfrak{g}$ -semisimple  $\mathbb{C}$  Lie algebra  $\rightsquigarrow R \subseteq \mathfrak{h}_{\mathbb{R}}^*$  is a reduced (abstract) root system  
 2) have a full classification of reduced root theorems - Main Theorem of Lecture 22

Q Does every reduced root system arise through a semisimple fin. dim.  $\mathbb{C}$  Lie algebra?

The goal for today is to provide the affirmative answer to this question.

We start with the following rather simple result:

Theorem 1: Let  $\mathfrak{g}$  be a semisimple Lie algebra with a root system  $R \subseteq \mathfrak{h}^*$ ,  
 $(-, -)$  be a nondegenerate invariant symmetric bilinear form on  $\mathfrak{g}$ ,  
 $R = R_+ \cup R_-$  be a polarization, and  $\Pi = \{\alpha_1, \dots, \alpha_r\}$  - the set of simple roots.

Then:

1) The subspaces  $\mathfrak{n}_{\pm} := \bigoplus_{\alpha \in R_{\pm}} \mathfrak{g}_{\alpha}$  are subalgebras of  $\mathfrak{g}$

AND  $\mathfrak{g} = \mathfrak{n}_- \oplus \mathfrak{h} \oplus \mathfrak{n}_+$  as a vector space.

2) Choose  $e_i \in \mathfrak{g}_{\alpha_i}$ ,  $f_i \in \mathfrak{g}_{-\alpha_i}$  so that  $(e_i, f_i) = \frac{2}{(\alpha_i, \alpha_i)}$ , and define  $h_i = h_{\alpha_i} \in \mathfrak{h}$  as in Lecture 16, so that  $\{e_i, f_i, h_i\}$  span an  $\mathfrak{sl}_2$ -subalgebra  $\mathfrak{sl}(\mathbb{C}, \mathbb{C})_{\alpha_i}$ .

Then  $\mathfrak{n}_+$  is generated by  $\{e_i\}_{i=1}^r$ ,  $\mathfrak{n}_-$  - by  $\{f_i\}_{i=1}^r$ ,  $\mathfrak{h}$  has a basis  $\{h_i\}_{i=1}^r$ .

Therefore,  $\mathfrak{g}$  is generated by  $\{e_i, f_i, h_i\}_{i=1}^r$ , as a Lie algebra.

3) The following relations hold:

$$(R1) \quad [h_i, h_j] = 0 \quad \forall i, j$$

$$(R2) \quad [h_i, e_j] = a_{ij} e_j, \quad [h_i, f_j] = -a_{ij} f_j \quad \forall i, j$$

$$(R3) \quad [e_i, f_j] = \delta_{ij} h_i \quad \forall i, j$$

$$(R4) \quad \text{ad}(e_i)^{1-a_{ij}}(e_j) = 0 \Leftrightarrow \underbrace{[e_i, [e_i, \dots [e_i, e_j] \dots]]}_{1-a_{ij}} = 0 \quad \forall i \neq j$$

$$(R5) \quad \text{ad}(f_i)^{1-a_{ij}}(f_j) = 0 \Leftrightarrow [f_i, [f_i, \dots [f_i, f_j] \dots]] = 0 \quad \forall i \neq j$$

Exercise: Verify that  $\mathfrak{n}_{\pm}$  are nilpotent and  $\mathfrak{k}_{\pm} := \mathfrak{h} \oplus \mathfrak{n}_{\pm}$  are solvable.

Proof of Theorem 1

1) Follows from  $[\mathfrak{g}_\alpha, \mathfrak{g}_\beta] \subseteq \mathfrak{g}_{\alpha+\beta}$ , since  $\forall \alpha, \beta \in \mathcal{R}_+$  either  $\alpha+\beta$  is not a root or is a positive root.

The vector space decomposition  $\mathfrak{g} = \mathfrak{n}_- \oplus \mathfrak{h} \oplus \mathfrak{n}_+$  is obvious.

2) The fact that  $\{h_i\}_{i=1}^r$  form a basis of  $\mathfrak{h}$  follows from the general statement that  $\Pi = \{\text{simple roots}\}$  form a basis of the underlying v-space.

Let us now verify that  $\mathfrak{n}_+$  is generated by  $\{e_i\}_{i=1}^r$ . Pick any  $\alpha \in \mathcal{R}_+ \setminus \Pi$ .

**Claim 1:**  $\exists i$  s.t.  $(\alpha, \alpha_i) > 0$

$\alpha \in \mathcal{R}_+ \Rightarrow \alpha = c_1 \alpha_1 + \dots + c_r \alpha_r, c_i \in \mathbb{Z}_{\geq 0}$

( $\alpha \notin \Pi \Rightarrow$  at least two of  $c_i$ 's are  $> 0$ )

If  $(\alpha, \alpha_i) \leq 0 \forall i \Rightarrow \alpha(\alpha, \alpha) = \sum c_i (\alpha, \alpha_i) \leq 0 \Rightarrow \alpha = 0 \quad \square$

Thus,  $(\alpha, -\alpha_i) < 0$  for some  $i \in \{1, \dots, r\} \Rightarrow \alpha - \alpha_i \in \mathcal{R}$  by [Lect 19, Corollary 1].

Set  $\beta := \alpha - \alpha_i$ , so that  $\alpha = \beta + \alpha_i$  and  $\beta \in \mathcal{R} = \mathcal{R}_+ \cup \mathcal{R}_-$ . Clearly,  $\beta \in \mathcal{R}_+$ !

$\Downarrow$  [Lecture 16, Thm 2]

$$\mathfrak{g}_\alpha = [\mathfrak{g}_\beta, \mathfrak{g}_{\alpha_i}]$$

Hence, arguing by induction on the height of roots (note:  $\text{ht}(\beta) < \text{ht}(\alpha)$ ), we get  $\mathfrak{n}_+ = \langle e_i \rangle_{i=1}^r$ , i.e.  $\mathfrak{n}_+$  is generated by  $\{e_i\}_{i=1}^r$ .

The proof for  $\mathfrak{n}_-$  is analogous (or take the opposite polarization).

3) - Relations (R1), (R2) are obvious ( $\mathfrak{h}$  - Cartan  $\Rightarrow$  abelian  
 $\mathfrak{g}_\alpha$  - joint eigenspaces for  $\text{ad}(\mathfrak{h})$ )

- (R3) for  $i=j$  is clear as  $h_i = [e_i, f_i]$

(R3) for  $i \neq j$  follows from  $\alpha_i - \alpha_j \notin \mathcal{R} \cup \{0\} \Rightarrow [e_i, f_j] = 0$

- To prove (R5) consider  $\bigoplus_{k \in \mathbb{Z}} \mathfrak{g}_{-\alpha_j + k\alpha_i}$  which is an irreducible  $\mathfrak{sl}(2, \mathbb{C})_{\alpha_i}$ -module  
 $\forall \alpha_i - \alpha_j \neq \dim!$  by [Lecture 16, Theorem 2]

But  $\text{ad}(e_i) f_j = 0$  by (R3)  $\Rightarrow f_j \in \mathfrak{g}_{-\alpha_j} \subset \mathfrak{V}_{\alpha_i, -\alpha_j}$  satisfies  $\text{ad}(e_i) f_j = 0$

$$\text{ad}(h_i) f_j = -a_{ij} f_j$$

Thus, by  $\mathfrak{sl}_2$ -theory [Lecture 7],  $\text{ad}(f_i)^{-a_{ij}} f_j = 0 \Rightarrow$  (R5)

- The proof of (R4) is analogous (or use the opposite polarization)

Lecture #23

Let  $R \subseteq E$  be any reduced root system. Pick a polarization  $R = R_+ \cup R_-$ ,  $\Pi = \{\alpha_i, \dots, \alpha_r\}$  - simple roots

Def 1: Let  $\mathfrak{g}(R)$  be the Lie algebra generated by  $\{e_i, f_i, h_i\}_{i=1}^r$ , with the defining rel-s (R1)-(R5) of Theorem 1.

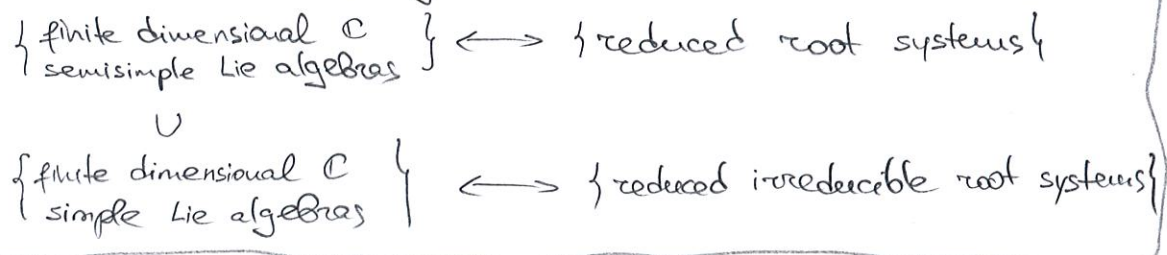

Theorem 2 (Serre theorem)

- 1) The Lie algebra  $\mathfrak{n}_+(R)$  of  $\mathfrak{g}(R)$ , generated by  $\{e_i\}_{i=1}^r$ , has the Serre rel-s  $\text{ad}(e_i)^{1-a_{ij}} e_j = 0$  as the defining rel-s. Similarly, the Lie subalgebra  $\mathfrak{n}_-(R)$  of  $\mathfrak{g}(R)$  generated by  $\{f_i\}_{i=1}^r$  has the Serre rel-s  $\text{ad}(f_i)^{1-a_{ij}} f_j = 0$  as the defining rel-s. Finally,  $\{h_i\}_{i=1}^r$  are linearly independent.
- 2)  $\mathfrak{g}(R)$  is a sum of  $\mathfrak{sl}(2, \mathbb{C})_{\alpha_i} = \langle e_i, f_i, h_i \rangle$ -modules
- 3)  $\mathfrak{g}(R)$  is  $\mathfrak{sl}(2, \mathbb{C})$ -dim- $l$
- 4)  $\mathfrak{g}(R)$  is semisimple and has root system  $R$ .

As an immediate corollary of Theorems 1, 2, we get:

Corollary 1: a) If  $\mathfrak{g}$  is a semisimple  $\mathbb{C}$  Lie algebra with a root system  $R$ , then there is a natural isomorphism  $\mathfrak{g} \cong \mathfrak{g}(R)$

b) There is a natural bijection

Finally, combining with Main Theorem of Lecture 22, we get

Corollary 2: Isomorphism classes of simple  $\mathbb{C}$   $\mathfrak{sl}(2, \mathbb{C})$ -dim- $l$  Lie algebras are in bijection with Dynkin diagrams

- $A_n (n \geq 1), B_n (n \geq 2), C_n (n \geq 3), D_n (n \geq 4), E_6, E_7, E_8, F_4, G_2$

Proof of Theorem 2

► We shall assume that  $R$  is irreducible, since  $\mathfrak{g}(R_1 \cup R_2) = \mathfrak{g}(R_1) \oplus \mathfrak{g}(R_2)$   
 [Exercise: verify the above equality.]

1) The proof of this step uses the following standard strategy.

First, consider a much bigger Lie algebra  $\tilde{\mathfrak{g}}(R)$  generated by  $\{e_i, f_i, h_i\}_{i=1}^r$  with the defining relations (R1)-(R3).

Claim 1 (easy exercise):  $\tilde{\mathfrak{g}}(R) = \tilde{\mathfrak{n}}_-(R) \oplus \tilde{\mathfrak{h}}(R) \oplus \tilde{\mathfrak{n}}_+(R)$  as a vector space,  
 where  $\tilde{\mathfrak{n}}_+(R)$  is gen-d by  $e_i$ 's,  $\tilde{\mathfrak{n}}_-(R)$  is generated by  $f_i$

(Hint: Use (R1)-(R3) to reorder terms  
 As per direct sum, use the  $\mathbb{Z}$ -grading with  $\deg(e_i) = 1 = -\deg(f_i)$ ,  $\deg(h_i) = 0$   
 and show that  $\tilde{\mathfrak{n}}_+(R) = \tilde{\mathfrak{g}}(R)_{>0}$ ,  $\tilde{\mathfrak{n}}_-(R) = \tilde{\mathfrak{g}}(R)_{<0}$ )

Claim 2: 1) The Lie algebra  $\tilde{\mathfrak{n}}_+(R)$  is a free Lie algebra in  $\{e_i\}_{i=1}^r$   
 2) The Lie algebra  $\tilde{\mathfrak{n}}_-(R)$  is a free Lie algebra in  $\{f_i\}_{i=1}^r$   
 3)  $\tilde{\mathfrak{h}}(R)$  has a basis  $\{h_i\}_{i=1}^r$

(Exercise: Prove Claim 2)

Hint: Construct an action of  $\tilde{\mathfrak{g}}(R)$  on  $\mathcal{U}(\underbrace{\mathbb{C}^r}_{\text{basis } \{h_i\}_{i=1}^r} \rtimes \text{Free Lie Algebra } \{e_i, f_i\}_{i=1}^r}) \simeq (\mathbb{C}[h_1, \dots, h_r]) \times (\mathbb{C}\langle e_i, f_i \rangle)$

Finally, consider the elements  $S_{ij}^+ := \text{ad}(e_i)^{-a_{ij}} e_j \in \tilde{\mathfrak{n}}_+(R)$   
 $S_{ij}^- := \text{ad}(f_i)^{-a_{ij}} f_j \in \tilde{\mathfrak{n}}_-(R)$ .

Claim 3:  $[f_k, S_{ij}^+] = 0 = [e_k, S_{ij}^-] \quad \forall k \in \{1, \dots, r\}$ .

(Exercise: Prove Claim 3)

Hint: for  $k \neq i$ , use  $[f_k, e_{\neq k}] = 0$ ,  $[f_k, e_k] = -h_k$   
 for  $k = i$ , use the  $\mathfrak{sl}_2$ -theory for  $\mathfrak{sl}(2, \mathbb{C})$ .

Thus: The ideal  $I$  of Serre rel-s  $(S_{ij}^+, S_{ij}^- \mid i \neq j)$  in  $\tilde{\mathfrak{g}}(R)$  can be written as

$$I = I_- \oplus I_+, \text{ where } I_{\pm} = (S_{ij}^{\pm} \mid i \neq j) \subset \tilde{\mathfrak{n}}_{\pm}(R)$$

Combining this with Claim 2 completes the proof of 1).

Lecture #23

(Continuation of the proof)

2) Due to Serre rebs, any of the generators  $\{e_j, f_j, h_j\}_{j=1}^r$  generates a fin. dim-l  $\mathfrak{sl}(2, \mathbb{C})_{\alpha_i}$ -submodule. On the other hand,  $\mathfrak{g}(R)$  is gen-d by these elements. Hence, the result follows from the following:

Claim 4: If  $a, b \in \mathfrak{g}(R)$  generate fin. dim-l  $\mathfrak{sl}(2, \mathbb{C})_{\alpha_i}$ -submodules, then (easy exercise) so does  $(a, b)$

3) The algebra  $\mathfrak{g}(R)$  is  $\mathbb{Q} := \bigoplus_{i=1}^r \mathbb{Z}\alpha_i$ -graded with  $\deg(e_i) = \alpha_i = -\deg(f_i), \deg(h_i) = 0$ .

So:  $\mathfrak{g}(R) \simeq \bigoplus_{\alpha \in \mathbb{Q}} \mathfrak{g}(R)_{\alpha}$  Clear:  $\mathfrak{g}(R)_{\alpha} = 0$  unless  $\alpha \in \bigoplus_{i=1}^r \mathbb{Z}_{\geq 0} \alpha_i$

On the other hand,  $\dim \underbrace{\mathfrak{g}(R)_{\pm \alpha}}_{\subset \mathfrak{n}_{\pm}(R)} < \infty \forall \alpha \in \bigoplus_{i=1}^r \mathbb{Z}_{\geq 0} \alpha_i$  for obvious reasons

It remains to show that  $\#\{\alpha \mid \mathfrak{g}(R)_{\alpha} \neq 0\} < \infty$ . In fact, we have:

Claim 5:  $\mathfrak{g}(R)_{\alpha} = 0$  if  $\alpha \notin R_{\text{root}}$

The proof is by induction on  $|\text{ht}(\alpha)|$ . Assume  $\alpha \in \bigoplus_{j=1}^r \mathbb{Z}_{\geq 0} \alpha_j$ . If  $\alpha = c\alpha_j$ , then  $\mathfrak{g}(R)_{\alpha} = \begin{cases} \mathbb{C}e_j, & c=1 \\ 0, & c>1 \end{cases}$ . Otherwise, as in Thm 1,  $\exists i$  s.t.  $(\alpha, \alpha_i) > 0$ .

Using part 2) and  $\mathfrak{sl}_2$ -theory:  $\mathfrak{g}(R)_{s_i(\alpha)} \neq 0 \Rightarrow s_i(\alpha) \in R_{\text{root}}$  by induction hypothesis. But  $R_{\text{root}}$  is  $W$ -invariant. Therefore,  $\alpha \in R_{\text{root}}$ .

Thus:  $\mathfrak{g}(R)$  is fin. dimensional.

4) As  $R = W(\Pi)$  and  $\dim \mathfrak{g}(R)_{\alpha_i} = 1$ , we see that  $\mathfrak{g}(R) = \bigoplus_{\alpha \in R} \mathfrak{g}(R)_{\alpha}$  (1-dim subspaces)

If  $I$  is a nonzero ideal, then:

Claim 6 (easy exercise):  $I$  contains  $\mathfrak{g}(R)_{\alpha}$  for some  $\alpha \neq 0$

Again using  $W$ -invariance of weights and  $R = W(\Pi)$ , we conclude  $\mathfrak{g}(R)_{\alpha_j} \subseteq I$ . Connecting with  $f_j$  over two times, we conclude  $e_j, f_j, h_j \in I$ . Now, if  $j \xrightarrow{\text{or multiple}} i$  in Dynkin diagram, then we also conclude  $e_i, f_i, h_i \in I$ .

As  $R$ -irreducible  $\Rightarrow$  Dynkin diagram - connected  $\Rightarrow e_i, f_i, h_i \in I \forall i \Rightarrow I = \mathfrak{g}(R)$ . So:  $\mathfrak{g}(R)$  is simple. Its root system is clearly  $R$
