Expected value for discrete random variables

Definition 5.

Let

- \mathbf{P} a probability on a sample space S
- $\mathcal{E} = \{x_i; i \geq 1\}$ countable state space, with $\mathcal{E} \subset \mathbb{R}$
- $X : S \rightarrow \mathcal{E}$ discrete random variable
- p pmf of X

Then we define

weighted avg. of x_i

$$\mathbf{E}[X] = \sum_{i \geq 1} x_i \mathbf{P}(X = x_i) = \sum_{i \geq 1} x_i \underbrace{p(x_i)}_{\text{weights}}$$

Justification of the definition

Experiment:

- Run independent copies of the random variable X
- For i -th copy, the measurement is z_i

Result (to be proved much later):

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=1}^n z_i = \mathbf{E}[X]$$

Example: dice rolling (1)

Definition of the random variable: we consider

$X =$ outcome when we roll a fair dice

Example: dice rolling (2)

$$\mathbb{E}(X) = 1 \times \frac{1}{6} + 2 \times \frac{1}{6} + \dots + 6 \times \frac{1}{6}$$

Recall: we consider

$$= \frac{1}{6} (1+2+\dots+6) = \frac{1}{6} \times \frac{(1+6) \times 6}{2} = \frac{7}{2}$$

X = outcome when we roll a **fair** dice

sample space

Pmf: We have $\mathcal{E} = \{1, \dots, 6\}$ and

$$p(1) = \dots = p(6) = \frac{1}{6}$$

Expected value: We get

$$\mathbb{E}[X] = \sum_{i=1}^6 i p(i) = \frac{1}{6} \sum_{i=1}^6 i = \frac{7}{2}$$

Example: indicator of an event (1)

Definition of the random variable:

Let A event with $P(A) = p$ and set

$$1_A = \begin{cases} 1 & \text{if } A \text{ occurs} \\ 0 & \text{if } A^c \text{ occurs} \end{cases}$$

p.m.f.

$$\Pr(1_A = 1) = P(A) = p$$

$$\Pr(1_A = 0) = 1 - P(A) = 1 - p$$

$$\begin{aligned} E(1_A) &= 1 \times p + 0 \times (1 - p) \\ &= p \\ &= P(A) \end{aligned}$$

Example: indicator of an event (2)

Recall:

Let A event with $\mathbf{P}(A) = p$ and set

$$\mathbf{1}_A = \begin{cases} 1 & \text{if } A \text{ occurs} \\ 0 & \text{if } A^c \text{ occurs} \end{cases}$$

Pmf:

$$p(0) = 1 - p, \quad p(1) = p$$

Expected value:

$$\mathbf{E}[\mathbf{1}_A] = p$$

Outline

- 1 Random variables
- 2 Discrete random variables
- 3 Expected value $E(X) = \sum_{i \geq 1} x_i p(x_i)$
- 4 Expectation of a function of a random variable e.g. $E(x^2)$, $E(e^x)$
- 5 Variance
- 6 The Bernoulli and binomial random variables
- 7 The Poisson random variable
- 8 Other discrete random variables
- 9 Expected value of sums of random variables
- 10 Properties of the cumulative distribution function

First attempt of a definition

Problem: Let

- X discrete random variable
- $Y = g(X)$ for a function g

How can we compute $\mathbf{E}[g(X)]$?

First strategy:

- $Y = g(X)$ is a discrete random variable
- Determine the pmf p_Y of Y
- Compute $\mathbf{E}[Y]$ according to Definition 5

First attempt: example (1)

① p.m.f for $g(X)=Y$

② $E(Y)$

$$X = \begin{cases} -1 & \text{w.p. } 0.2 \\ 0 & \text{w.p. } 0.5 \\ 1 & \text{w.p. } 0.3 \end{cases}$$

Definition of a random variable X :

Let $X : S \rightarrow \{-1, 0, 1\}$ with

$$\mathbf{P}(X = -1) = .2, \quad \mathbf{P}(X = 0) = .5, \quad \mathbf{P}(X = 1) = .3$$

We wish to compute $E[X^2]$

$Y = X^2$, p.m.f. for Y

$$1 \times 0.2 + 0 \times 0.5$$

$$= 0.2 \quad Y = \begin{cases} 1 & \text{w.p. } 0.2 \\ 0 & \text{w.p. } 0.5 \end{cases}$$

$$E(Y) = 0.2 = \Pr(Y=1)$$

$$\Leftarrow Y = \begin{cases} 1 & \text{w.p. } 0.2 \\ 0 & \text{w.p. } 0.5 \\ 1 & \text{w.p. } 0.3 \end{cases}$$

First attempt: example (2)

Definition of a random variable Y : Set $Y = X^2$.

Then $Y \in \{0, 1\}$ and

$$\mathbf{P}(Y = 0) = \mathbf{P}(X = 0) = .5$$

$$\mathbf{P}(Y = 1) = \mathbf{P}(X = -1) + \mathbf{P}(X = 1) = .5$$

First attempt: example (3)

Recall: For $Y = X^2$ we have

$$\mathbf{P}(Y = 0) = .5, \quad \mathbf{P}(Y = 1) = .5$$

Expected value:

$$\mathbf{E}[X^2] = \mathbf{E}[Y] = .5$$

Definition of $\mathbb{E}[g(X)]$

Proposition 6.

Let

- X discrete random variable
- p pmf of X
- g real valued function

$$\mathbb{E}(X) = \sum_{i \geq 1} x_i p(x_i)$$

(Handwritten note: x_i is circled in red, and $p(x_i)$ is underlined with a green wavy line. An arrow points from x_i to the $g(x_i)$ term in the equation below.)

Then

$$\mathbb{E}[g(X)] = \sum_{i \geq 1} g(x_i) p(x_i) \quad (1)$$

(Handwritten notes: $\mathbb{E}[g(X)]$ is underlined in red. $g(x_i)$ is highlighted in green. $p(x_i)$ is underlined with a green wavy line.)

$$\text{Let } g(x) = Y$$

$$E(Y) = \sum_{j \geq 1} y_j \cdot \Pr(Y = y_j)$$

$$\Pr(Y = y_j) = \sum_{i: g(x_i) = y_j} \Pr(X = x_i)$$

$$E(Y) = \sum_{j \geq 1} y_j \sum_{i: g(x_i) = y_j} \Pr(X = x_i)$$

$$= \sum_{j \geq 1} \sum_{i: g(x_i) = y_j} y_j \Pr(X = x_i)$$

$$= \sum_{j \geq 1} \sum_{i: g(x_i) = y_j} \underbrace{g(x_i) \Pr(X = x_i)}_{\text{no } j \text{ index}} = \sum_{i \geq 1} g(x_i) \underbrace{\Pr(X = x_i)}_{p(x_i)}$$

$$X = \begin{cases} -1 \\ 0 \\ 1 \end{cases}$$

$$Y = X^2$$

$$\Pr(Y = 1) = \Pr(X = -1) + \Pr(X = 1)$$

Proof

Values of Y : We set $Y = g(X)$ and

$$\{y_j; j \geq 1\} = \text{values of } g(x_i) \text{ for } i \geq 1$$

Expression for the rhs of (1): gather according to y_j

$$\begin{aligned} \sum_{i \geq 1} g(x_i) p(x_i) &= \sum_{j \geq 1} \sum_{i; g(x_i)=y_j} y_j p(x_i) \\ &= \sum_{j \geq 1} y_j \sum_{i; g(x_i)=y_j} p(x_i) \\ &= \sum_{j \geq 1} y_j \mathbf{P}(g(X) = y_j) \\ &= \sum_{j \geq 1} y_j \mathbf{P}(Y = y_j) \\ &= \mathbf{E}[g(X)] \end{aligned}$$

Previous example reloaded

$$\mathbf{E}(X^2) = (-1)^2 \times 0.2 + 0^2 \times 0.5 + 1^2 \times 0.3 = 0.5$$

Definition of a random variable X :

Let $X : S \rightarrow \{-1, 0, 1\}$ with

$$\mathbf{P}(X = -1) = .2, \quad \mathbf{P}(X = 0) = .5, \quad \mathbf{P}(X = 1) = .3$$

We wish to compute $\mathbf{E}[X^2]$

Application of (1):

$$\mathbf{E}[X^2] = \sum_{i=-1,0,1} i^2 p(x_i) = .5$$

Example: seasonal product (1)

Situation:

- Product sold seasonally
- Profit b for each unit sold
- Loss ℓ for each unit left unsold
- Product has to be stocked in advance
 \rightarrow s units stocked

If $X > S$, then all the stocks will be sold
making a profit of $b \cdot S$

If $X \leq S$, then X units sold, $(S-X)$ unsold

Random variable:

- $X = \#$ units of product ordered by customers
- Pmf p for X

Question:

Find optimal s in order to maximize profits

expected
↑

Example: seasonal product (2) $\mathbb{E}(Y_{s+1}) - \mathbb{E}(Y_s) > 0$

Some random variables: We set

$\rightarrow \mathcal{E} = \{0, 1, 2, \dots\}$

$X =$ # units ordered, with pmf p

$Y_s =$ profit when s units stocked

Expression for Y_s :

indicator

$$Y_s = (bX - (s - X)l) \mathbf{1}_{(X \leq s)} + s b \mathbf{1}_{(X > s)} = g(X)$$

Expression for $\mathbb{E}[Y_s]$:

$$\mathbb{E}[Y_s] = \sum_{i=0}^s (bi - (s - i)l) p(i) + \sum_{i=s+1}^{\infty} s b p(i)$$

Simplify $\rightarrow \mathbb{E}(Y_{s+1})$

$s b \left[\sum_{i=0}^{\infty} p(i) - \sum_{i=0}^s p(i) \right]$

$\rightarrow \sum_{i=0}^s$

$$E(Y_s) = \sum_{i=0}^s (bi - (s-i)l) p(i) + sb \left[1 - \sum_{i=0}^s p(i) \right]$$

$$= sb + \sum_{i=0}^s [bi - (s-i)l - sb] p(i)$$

$$\begin{aligned} & \underline{bi} - sl + il - \underline{sb} \\ & = b(i-s) + l(i-s) = (i-s)(b+l) \end{aligned}$$

$$= sb + \sum_{i=0}^s (i-s)(b+l) p(i)$$

Example: seasonal product (3)

Simplification for $\mathbf{E}[Y_s]$: We get

$$\mathbf{E}[Y_s] = s b + (b + \ell) \sum_{i=0}^s (i - s) p(i) \quad \leftarrow$$

Growth of $s \mapsto \mathbf{E}[Y_s]$: We have

$$\mathbf{E}[Y_{s+1}] - \mathbf{E}[Y_s] = b - (b + \ell) \sum_{i=0}^s p(i)$$
